Research Highlights

Spacetime Symmetries Possible violations of spacetime symmetries provide uniquely precise tests of new physics at high energies. I pioneered the study of Lorentz violation through low-energy effective Lagrangians, including proposed observational tests [1, 18]. I also proposed some of the first experimental limits on non-commutative modifications of electromagnetism [29], and constraints on dynamical Lorentz-violating fields [35, 45, 52, 53]. On cosmological scales, I have developed frameworks in which to analyze possible large-scale deviations from cosmological isotropy [44, 46, 48, 50].

Dark Matter, Dark Energy, Dark Forces I proposed experimental constraints on dynamical dark energy through its coupling to other fields, as well as suggesting how to avoid those constraints by imposing symmetries [22]. The best-motivated models of dark energy predict cosmological birefringence at a potentially observable level, which is currently being searched for observationally. I also pioneered theories of dark matter coupled to long-range forces [19, 47, 55, 61], including the possibility of an unbroken analogue of electromagnetism in the dark sector [49].

Modified Gravity Understanding the acceleration of the universe, usually attributed to dark energy, is one of the major challenges in theoretical physics today. Since our evidence for dark energy is exclusively through its gravitational effects, I suggested that a simple modification of Einstein's equation, known as $f(R)$ gravity, could cause acceleration without dark energy [34, 37, 43]. This idea now serves as a popular testing ground for cosmological deviations from general relativity. I explored modifications of GR due to extra dimensions [28, 33, 41] and proposed observational tests [23, 30].

Origin of the Universe & the Arrow of Time One major clue to the origin of the universe is the low entropy of the early state, responsible for the arrow of time. I proposed the first time-symmetric model of a multiverse in which the thermodynamic arrow of time arises naturally [38,39]. I have developed measures of cosmological fine-tuning [59, 63, 67, 70], and studied the possibility of the universe fluctuating into a proto-inflationary state [60]. I showed for the first time how cosmic evolution could spontaneously compactify dimensions of spacetime [56].

Foundations of Quantum Mechanics In the Everett or Many-Worlds formulation of quantum mechanics, the Born rule, that probabilities are given by the amplitude squared, must be derived rather than postulated. I proposed a new solution to this problem based on the notion of self-locating uncertainty [65, 69]. Applying the Everett formulation to cosmology and gravitation, I argued that it is possible to sidestep the Boltzmann Brain problem if Hilbert space is infinite-dimensional [66], and that black hole firewalls can be avoided if there are a sufficient number of branches of the wave function [86].

Emergent Spacetime The most minimal approach to quantum theory is one where both spacetime and fields are emergent from the kinematics and dynamics of a state vector in Hilbert Space evolving under a given Hamiltonian, an approach we dubbed "Mad-Dog Everettianism" [88]. The geometry of space can be defined by the entanglement of Hilbert-space factors [76], and Einstein's equation for gravity emerges from a requirement of entanglement equilibrium [85].

Statistical Mechanics and Complexity I have argued that, while entropy increases in closed systems, natural measures of "complexity" first increase and then decrease [68]. I have proposed a new Bayesian formulation of the Second Law of Thermodynamics, which incorporates the outcomes of measurements into a tighter inequality obeyed by the evolution of open systems [74].
